

GitHub renders Mermaid natively. For other viewers, paste a block into <https://mermaid.live>.

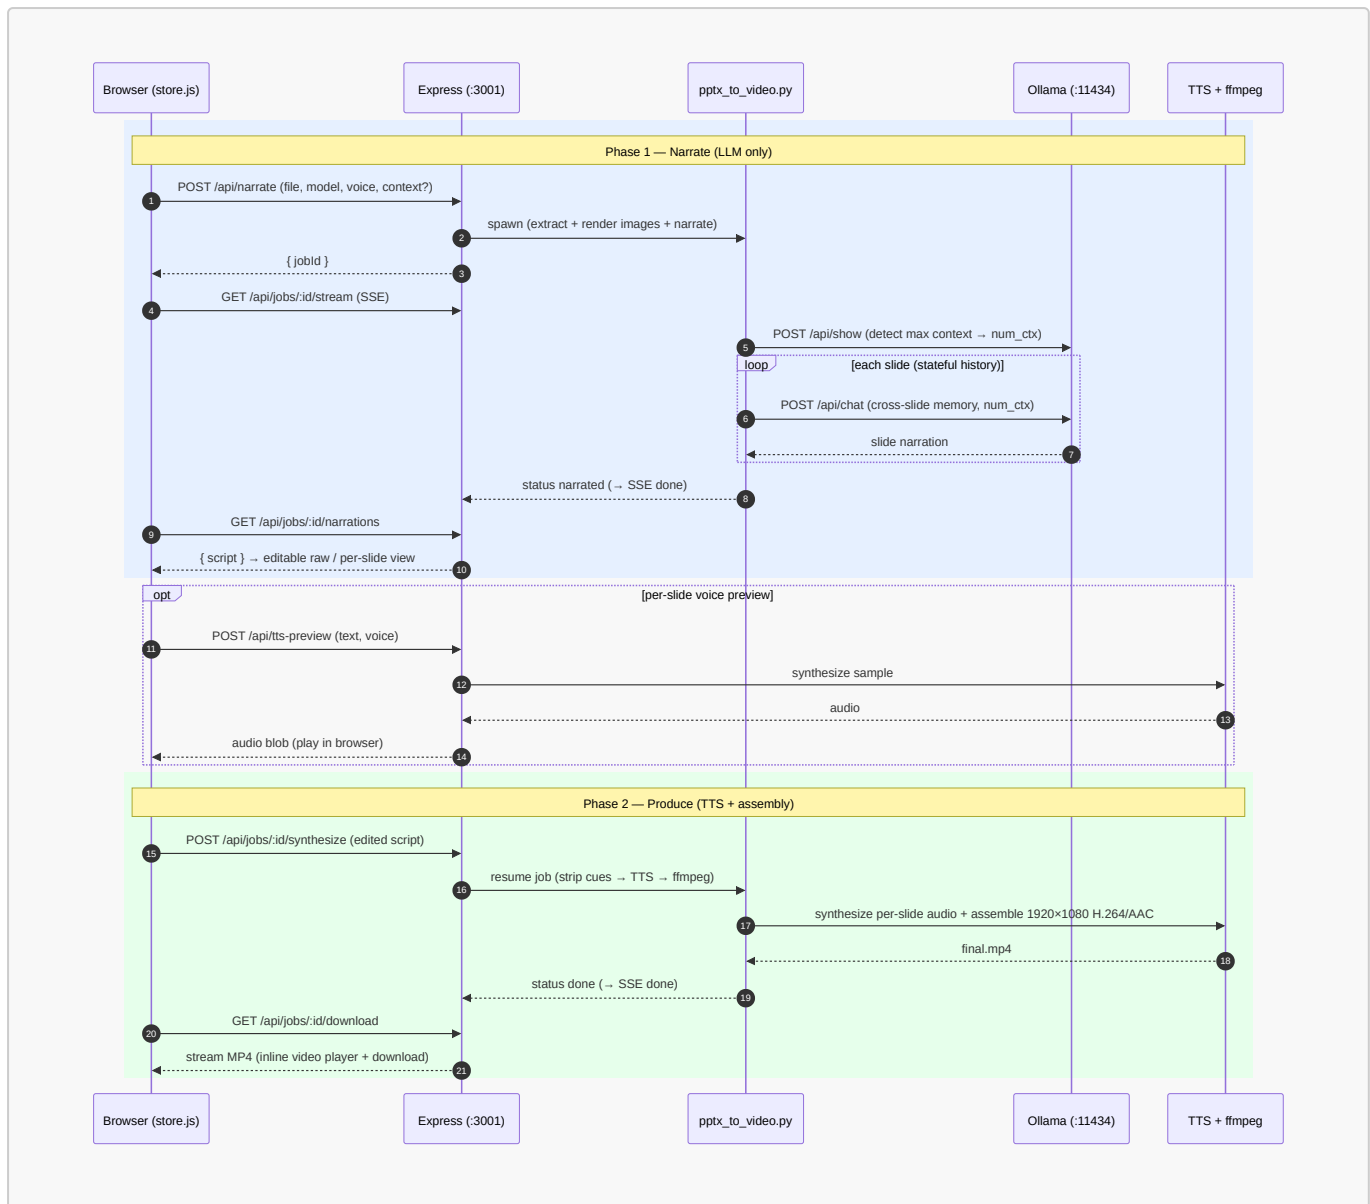

How the layers connect: the Vue SPA talks only to Express; Express spawns short-lived Python helpers that call Ollama and the media tools.

3. Narrate / Produce workflow

Two phases that share one job id: phase 1 generates an editable script; phase 2 synthesizes audio and assembles the MP4.

Notes

- **One server, one SSE channel.** Every mode reuses the in-memory `jobs` Map and `GET /api/jobs/:id/stream`; review/rewrite add typed `persona/report/slug` events on top of the generic `log/done` events.
- **Subprocess bridge pattern.** Python does the heavy lifting and streams stdout; Node never embeds a second long-running server.
- **Context window.** Both bridges call Ollama `/api/show` and pass the model's max `num_ctx`, so stacked review prompts and stateful narration history aren't truncated (`REVIEWER_NUM_CTX / NARRATE_NUM_CTX` override).
